#### Matillion ETL Connector

[Matillion Metadata API](#)[Downloads](#)[Installation Instructions](#)

## Matillion Metadata API

Retrieve SQL statements executed with this [API Extract](#) that connects to the [Metadata API](#) of your Matillion ETL instance.

After importing this connector, use an API Extract component in an Orchestration Job to query the metadata.

The screenshot displays the Matillion interface. At the top, a workflow diagram shows a 'Start 0' job (represented by a play button icon) connected to an 'API Extract 0' job (represented by a cloud icon with a list symbol). Below the workflow, there is a tabbed interface with 'Properties', 'Export', and 'Help' tabs. The 'Properties' tab is active, showing a table for the 'API Extract' job. The table has columns for 'Name', 'Value', and 'Status'. The 'Name' column lists 'Name', 'Profile', 'Data Source', and 'URI Params'. The 'Value' column lists 'API Extract 0', 'matillion\_metadata\_api...', 'lineage', and 'mtln\_project, Demo, mtl...'. The 'Status' column shows 'OK' for all entries. There are also '...' icons next to the 'Value' entries.

Name	Value	Status
Name	API Extract 0	OK
Profile	matillion_metadata_api...	OK
Data Source	lineage	OK
URI Params	mtln_project, Demo, mtl...	OK

You can also download [this pair of Matillion ETL jobs](#) that demonstrate how to use this connector as part of a medallion data architecture.

## Prerequisites

The Metadata API is an [Enterprise Mode](#) feature.
